For this map I had some trouble finding good data. I eventually just used the same website where you got the data for the first map. I found an Asheville law district map and a table with 911 calls for stabbings in Asheville. I had some trouble converting the csv table to geojson but then I got that uploaded in atom. I copied the code from the airbnb map and started changing things to be specific to my map. There were a couple things I had problems with, I couldnt change the symbol from the airbnb logo to a knife without them all disapperaing. I also had problems with the colors of the law districts as I was trying to make them different shades of red based on the amount of 911 calls. Besides that and the data collection part this map went relatively smoothly. I think I need to get better and be able to find good data.
